

She must be in:

C:\Users\witha\smart-healthcare-microservices

Part 3 — hard reset the local branch state

Run these commands exactly:

```
git checkout feature/doctor-telemedicine
git fetch origin
git reset --hard origin/feature/doctor-telemedicine
git clean -fd
```

What this does

- makes local feature branch exactly same as GitHub branch
 - removes broken local uncommitted changes
 - removes the dirty state that is blocking pull
-

Part 4 — now update **dev**

Run:

```
git checkout dev
git fetch origin
git reset --hard origin/dev
```

Now local **dev** becomes exactly same as remote **dev**.

Part 5 — go back to her feature branch

Run:

```
git checkout feature/doctor-telemedicine
git merge dev
```

At this point, **if Git again says package-lock conflict**, do this:

```
del backend\services\doctor-service\package-lock.json
cd backend\services\doctor-service
npm install
cd ..\..\..
git add backend/services/doctor-service/package-lock.json
git commit -m "fix(doctor): regenerate package-lock after merge conflict"
git push origin feature/doctor-telemedicine
```

Even simpler version

Tell her to copy-paste this whole block from project root:

```
git checkout feature/doctor-telemedicine
git fetch origin
git reset --hard origin/feature/doctor-telemedicine
git clean -fd
git checkout dev
git fetch origin
git reset --hard origin/dev
git checkout feature/doctor-telemedicine
git merge dev
```

If merge stops on `package-lock.json`, then run:

```
del backend\services\doctor-service\package-lock.json
cd backend\services\doctor-service
npm install
cd ..\..\..
git add backend/services/doctor-service/package-lock.json
git commit -m "fix(doctor): regenerate package-lock after merge conflict"
git push origin feature/doctor-telemedicine
```

Why this happened

Because she:

- deleted and regenerated `package-lock.json`
- committed it on feature branch
- then switched branches with local modified files still hanging around
- then `dev` pull got blocked

- meanwhile GitHub PR still saw the merge conflict

So the fix is:

reset local branches cleanly, then merge again cleanly

Important note

She used:

```
rm package-lock.json
```

That failed because Windows CMD does not use `rm`.

In **CMD**, use:

```
del package-lock.json
```

In **PowerShell**, use:

```
Remove-Item package-lock.json
```

What success looks like

At the end:

- `git status` should say clean
 - `git merge dev` should complete
 - if conflict happened, regenerated `package-lock.json` should fix it
 - `git push origin feature/doctor-telemedicine` should update branch
 - GitHub PR conflict banner should disappear
-

If she wants the safest route of all

If this still acts weird, do this nuclear-safe option:

from project root

```
git checkout feature/doctor-telemedicine
git fetch origin
git reset --hard origin/feature/doctor-telemedicine
del backend\services\doctor-service\package-lock.json
cd backend\services\doctor-service
npm install
cd ..\..\..
git add backend/services/doctor-service/package-lock.json
git commit -m "fix(doctor): regenerate package-lock cleanly"
git push origin feature/doctor-telemedicine
git fetch origin
git merge origin/dev
git push origin feature/doctor-telemedicine
```

Send me the exact output of `git merge dev` after she runs the first block
